**Botanical Name**: Graptophyllum llicifollum
**Common Name:** Holly-leaved fuchsia
**Origin:** Known to occur only in the Eungella region to the west of Mackay, Queensland
**Height/Width:** approx. 3-5 m x 2-3m
**Habit:** Tall erect shrub
**Flower**: Bright scarlet tubular about 3cm in length, borne in pairs or clusters along the stems, opposite the leaves. Seed capsules are club shaped, dry and woody and contain 2 seeds. Bird and native bee attracting.
**Leaves:** Broadly egg-shaped with toothed margins, borne alternately on the stem but opposing the leaf is a flower cluster usually accompanied by a small leaf bract which has the appearance of a dwarf leaf. If the flower does not develop (or after it has fallen) the leaf and bract appear to be opposite leaves of differing sizes.

**Climate**: Tropical and sub-tropical to temperate
**Soil:** Fertile, moist but well drained. Water well and fertilise during growing season.
**Aspect**. Grows best in light shade but can be grown in full sun.
**Prune:** Prune after flowering to maintain compact shape.
**Drought/Frost:** Tolerant once established/Tender
**Propagation:** Strikes easily from cuttings or fresh seeds.

**NOTE:** Classified as a vulnerable plant as it faces a high risk of extinction in the wild.
